

Post-Launch Edits and Adjustments

This report summarizes the website edits, feature additions, integrations, tracking updates, SEO work, and reliability improvements completed after the site went live.

Report window: June 1-26, 2026.

Executive Summary

The post-launch work focused on converting the site from a polished marketing website into a measurable lead-generation system: stronger forms, Sanity-backed CRM storage, email notifications, branded confirmations, conversion tracking, SEO improvements, service-page imagery, and a faster initial bundle.

Summary Metrics

- Report window: June 1-26, 2026
- Post-launch commits: 50+
- Current initial JavaScript before gzip: 371 KB
- Core intake endpoints: 2

Major Change Areas

Lead Capture & Forms

Stepper expanded into a qualified 4-step lead flow. Contact page now captures address, ZIP, service, project details, and routes to the backend.

Email & CRM Workflow

Added Sanity-backed project inquiries and candidate applications, internal notifications, branded customer confirmation emails, Gmail App Password support, and SMTP fallback.

Analytics & Ads

Added GA4, Google Ads base tag, form conversion, thank-you conversion, phone click conversion, enhanced conversions in-page user data, and attribution capture.

SEO & Content

Unified publications/blog hub, added FAQ page with FAQPage structured data, Bing verification, route prerender coverage, metadata refinements, and link-preview assets.

Showroom & Service Pages

Added/updated service galleries, showroom brand imagery, showroom video showcase, certified installer messaging, and fixes for brand pills, image positioning, and video autoplay.

Performance & Reliability

Code-split page routes, reduced initial JS from roughly 750 KB to 371 KB before gzip, fixed prerender timeouts caused by analytics, and improved production deploy flow.

Deployment Timeline

- Jun 1-2: Hero/link preview fixes - stopped hero frame flash and corrected social preview imagery.
- Jun 9: Navigation, service pages, promotions - tightened nav, added Bing verification, expanded basement/additions imagery, overhauled promotions.
- Jun 10: Showroom, careers, Sanity intake - added Careers, Sanity CRM schemas/API endpoints, showroom video and brand/product updates, Design/About fixes.
- Jun 16-17: Analytics and conversion tracking - added GA4, Google Ads, form conversion tracking, thank-you redirect, attribution storage, weekend hours.
- Jun 23-24: Lead generation upgrades - added FAQ, unified publications/blog, \$500 popup, branded prospect emails, click-to-call tracking, and stepper/contact fixes.
- Jun 25-26: Email reliability and speed - added Gmail App Password/SMTP fallback, redeployed for env vars, and code-split route bundles for faster initial load.

Detailed Report

Lead Capture and Intake

- Lead Stepper now asks project type, timeline, project details, preferred contact method, name, phone, email, project address, and required ZIP.
- Contact page form now submits to /api/project-inquiry and includes address, ZIP, project details, service type, and attribution.
- \$500 offer popup submits to the same backend so promotional leads land in Sanity with the rest of the project inquiries.
- Form submissions redirect to /thank-you for conversion tracking instead of leaving users in a modal-only success state.
- Honeypot spam fields were added to reduce automated form abuse without affecting normal users.

Email and Sanity CRM

- Project inquiries are stored as Sanity projectInquiry documents with status, priority, attribution, raw payload, and notification status.
- Candidate applications are stored as Sanity candidateApplication documents with role, experience, links, and notification status.
- Internal operations emails are sent on project inquiries and candidate applications.
- Prospects receive branded confirmation emails matching Sure-Fix styling, with a PNG logo created for email-client compatibility.
- Applicants now receive branded confirmation emails after submitting a career application.
- Email delivery supports Gmail OAuth, Gmail App Password, or generic SMTP. App Password is the recommended production path.

Analytics, Ads, and Attribution

- GA4 tag G-RE67MCL4PC added site-wide.
- Google Ads tag AW-18229674384 added site-wide.
- Form submission conversion and thank-you page conversion were wired into the analytics layer.
- Phone numbers were converted to clickable tel: links where needed, and all phone clicks now fire the click-to-call conversion label.
- Google Ads enhanced conversions were updated based on the diagnostics alert to use manual in-page code in addition to automatic collection.

- Lead forms now pass first-party user data to the Google tag before conversion events: email, phone number, first name, last name, postal code, and country where available.
- The thank-you page reads pending enhanced-conversion user data from session storage so redirect-based conversion events also include user-provided data.
- UTM parameters, Google/Bing/Facebook click IDs, referrer, landing page, and conversion page are captured and sent with inquiries.
- Analytics/conversions are skipped during headless prerendering to prevent build-time timeouts and avoid false conversion pings.

Content, SEO, and Routing

- Publications and blog were consolidated into a single /publications hub.
- Old /blog index now redirects to /publications, while individual /blog/:slug routes remain supported.
- FAQ page was added and wired into navigation, footer, SEO config, and prerender routes.
- FAQPage structured data was added for search eligibility.
- Bing Webmaster verification meta tag was added.
- Google/iMessage link previews were updated with showroom poster/video assets and H.264-compatible video.

Visual and UX Adjustments

- Welcome loader added before the site appears.
- Scroll position preservation added for browser refreshes.
- Hero scroll indicator and nav layout were refined.
- Weekend hours added across visible business-hour areas.
- Showroom page fixes included Cambria image positioning, flooring brand pill spacing, plumbing brand pills, and video autoplay.
- Popup behavior was adjusted so it is visible again, uses a new storage key, and does not appear on /contact where it could block the form.

Service Pages and Image Assets

- Basement and additions pages received expanded imagery and improved customer-focused copy.
- Basement page now emphasizes usable square footage gains.
- Additions page includes in-law suite language.
- Exterior galleries were replaced/expanded with outdoor living, roof, siding, fence, and pool-deck assets.
- Flooring gallery was replaced with tile, luxury carpet, office carpet, LVP, and a floor-focused basement image.
- Bathroom gallery received an additional portfolio image.
- Images containing competitor/signage issues were replaced.

Careers and Hiring

- Careers page was added and linked from nav/footer.
- Careers page was included in prerendering.
- Plumber role was added.
- Project Manager role and salary ranges were removed.
- Career application modal submits to Sanity and now sends internal and applicant confirmation emails.

Performance and Build Reliability

- Route-level code splitting was added in App.tsx.
- Initial JS bundle reduced from roughly 750 KB to 371 KB before gzip.

- Prerender script coverage was updated for new routes like /faq, /careers, and /thank-you.
- Analytics calls are disabled for Puppeteer/headless prerender to prevent networkidle0 timeouts.
- Vercel production redeploys were triggered after email env-var changes so serverless functions picked up the latest configuration.

Known External Dependencies

- Adaptify blog publishing: the live Sanity project kqp67u17 / production currently has zero post documents. The site is ready to display Sanity posts, but Adaptify is not publishing into this dataset.
- Email operations validation: Gmail App Password setup was added and production was redeployed. Continue monitoring real submissions and spam/promotions folders for the operations inbox.
- Ongoing performance: future improvements could include image audits, route preloading strategy, and further vendor chunk splitting if traffic data shows a need.

Most Recent Production Work

The most recent production changes improved the Contact page form, re-enabled visible popup behavior without blocking the Contact page, added Gmail App Password and SMTP email fallback support, added applicant confirmation emails, reduced the initial JavaScript bundle through route-level code splitting, and added manual enhanced conversions user data for Google Ads lead forms.

Google Ads diagnostics flagged enhanced conversions coverage with the alert 'Implement in-page code in addition to Automatic for better results.' The site was updated to send manual enhanced-conversion user data through the Google tag on project lead conversions.
