

Color Palette

PRIMARY COLORS

Primary colors should be used most often and act as the main visual identifiers of the brand. Use these colors for key headlines, calls-to-action, buttons, highlights, and moments where you want to draw attention.

To maintain a clean and balanced look, avoid using primary colors as full-page or long-form backgrounds. Instead, let them appear as accents or emphasis within layouts.

SECONDARY COLORS

Secondary colors are supporting colors and should be used sparingly. These tones work best for backgrounds, supporting elements, dividers, and areas where a softer visual presence is needed.

Alabaster Grey or white-leaning neutrals should be used most often for backgrounds to create white space, improve readability, and keep layouts clean and professional.

Logo

PRIMARY LOGO

ALTERNATE COLORWAYS

Logos are available in blue/red combination (preferred), black, white, blue, and red colorways – never alter the color of the logo. Choose the color that works best for the context. For example, make sure there is sufficient contrast between the logo and the background. Do not apply drop shadows, glows, or strokes to any version of the logo. Use the primary blue/red combination on most applications (whenever possible).

GOOD CONTRAST

BAD CONTRAST

Proper color contrast is essential for readability and accessibility. Avoid color combinations that reduce legibility, and always choose high-contrast pairings to ensure the brand remains clear, professional, and inclusive.

Typography - Usage & Hierarchy

FigTree

Figtree is available from Google Fonts.

Figtree will always be used larger than Georgia in any design - web, social media, signage, marketing materials, etc.

The **bold weight** should be used more often. However, combination of the bold with contrasting light is also recommended (see this treatment in the logo).

Georgia

Georgia is available from Google Fonts.

Use Georgia for your longer blocks of text.

Make sure it is always used smaller than Figtree.

Quick Rules

- Use primary colors for emphasis, not entire pages
- Use neutral backgrounds (White or Alabaster Grey) for long-form text
- Avoid stacking multiple bold colors together
- Prioritize contrast for readability at all times
- Avoid excessive font styles, weights, or sizes in one layout
- Use generous white space to keep layouts clean and professional

When in doubt, prioritize clarity, consistency, and simplicity. These principles ensure the brand remains professional, recognizable, and effective across all marketing materials.
